Inspection Report

Belgrave House
Stakes Hill Road
Waterlooville
Portsmouth
PO7 7LT
Tel: 023 9225 2951

Date of inspection visit: 16/08/2016

Date of publication: 28/09/2016

Overall summary

We carried out an announced comprehensive inspection on 16 August 2016 to ask the practice the following key questions;

Are services safe, effective, caring, responsive and well-led?

Our findings were:

Are services safe?

We found that this practice was providing safe care in accordance with the relevant regulations.

Are services effective?

We found that this practice was providing effective care in accordance with the relevant regulations.

Are services caring?

We found that this practice was providing caring services in accordance with the relevant regulations.

Are services responsive?

We found that this practice was providing responsive care in accordance with the relevant regulations.

Are services well-led?

We found that this practice was providing well-led care in accordance with the relevant regulations.

Background

Jeffrey Tan is a dental practice providing private treatment for both adults and children. The practice is based in a converted domestic dwelling in Waterlooville, a town situated north of Portsmouth, Hampshire.

The practice has two dental treatment rooms. One of which is based on the ground floor and a separate decontamination room used for cleaning, sterilising and packing dental instruments. The ground floor is accessible to wheelchair users, prams and patients with limited mobility via a ramp which staff make available when required.

The practice employs two dentists, one dental therapist, one hygienist and two dental nurses of which one is a trainee on a recognised course.

The practice's opening hours are between 9am and 4pm on Monday, Wednesday and Friday and 9am and 5pm on Tuesday and Thursday.

There are arrangements in place to ensure patients receive urgent medical assistance when the practice is closed. This is provided by the principle dentist who is the practice owner.

Mr Jeffrey Tan is registered as an individual and is legally responsible for making sure that the practice meets the requirements relating to safety and quality of care, as

Summary of findings

specified in the regulations associated with the Health and Social Care Act 2008. Like registered providers, they are 'registered persons'. Registered persons have legal responsibility for meeting the requirements in the Health and Social Care Act 2008 and associated Regulations about how the practice is run.

We obtained the views of six patients on the day of our inspection.

Our key findings were:

- We found that the practice ethos was to provide patient centred dental care in a relaxed and friendly environment.
- Leadership was provided by the principle dentist who was the practice owner.
- Staff had been trained to handle emergencies and appropriate medicines and life-saving equipment was readily available in accordance with current guidelines.
- The practice appeared clean and well maintained.
- There was appropriate equipment for staff to undertake their duties, and equipment was well maintained.
- Infection control procedures were robust and the practice followed published guidance.
- The practice owner acted as the safeguarding lead with effective processes in place for safeguarding adults and children living in vulnerable circumstances.
- There was a process in place for the reporting and shared learning when untoward incidents occurred in the practice.
- Dentists provided dental care in accordance with current professional and National Institute for Care Excellence (NICE) guidelines.

- The service was aware of the needs of the local population and took these into account in how the practice was run.
- Patients could access treatment and urgent and emergency care when required.
- Staff received training appropriate to their roles and were supported in their continued professional development (CPD) by the practice owner.
- Staff we spoke with felt very well supported by the practice owner and were committed to providing a quality service to their patients.
- Information from 25 completed Care Quality Commission (CQC) comment cards gave us a positive picture of a friendly, caring, professional and high quality service.

There were areas where the provider could make improvements and should:

- Consider installing a hearing loop for patients with hearing difficulties.
- Consider re-establishing the system for receiving national alerts such as those from Medicines and Healthcare Regulatory Agency (MHRA).
- Consider providing the hygienist with the support of an appropriately trained member of the dental team on all occasions.
- Consider securing the decontamination room.
- Review the security of the window blind cords in the waiting room and decontamination room.
- Review the practice recruitment policy to ensure that pre-employment checks are in accordance with Schedule 3 of the Health and Social Care Act.
- Review fire safety monitoring in the practice to include checks of alarms, fire extinguishers, fire drills and fire risk assessment reviews.
- Review the processes and procedures relating to interpreter services for patients whose first language is not English.

Summary of findings

The five questions we ask about services and what we found

We always ask the following five questions of services.

Are services safe?

We found that this practice was providing safe care in accordance with the relevant regulations.

The practice had arrangements in place for essential areas such as infection control, clinical waste control, management of medical emergencies at the practice and dental radiography (X-rays). We found that all the equipment used in the dental practice was well maintained.

The practice took its responsibilities for patient safety seriously and staff were aware of the importance of identifying, investigating and learning from patient safety incidents.

Staff had received safeguarding training and were aware of their responsibilities regarding safeguarding children and vulnerable adults.

No action

Are services effective?

We found that this practice was providing effective care in accordance with the relevant regulations.

The dental care provided was evidence based and focussed on the needs of the patients. The practice used current national professional guidance including that from the National Institute for Health and Care Excellence (NICE) to guide their practice.

We saw examples of positive teamwork within the practice and evidence of good communication with other dental professionals. The staff received professional training and development appropriate to their roles and learning needs.

No action

Are services caring?

We found that this practice was providing caring services in accordance with the relevant regulations.

We obtained the views of six patients on the day of our visit. These provided a positive view of the service the practice provided.

All of the patients commented that the quality of care was very good. Patients commented on friendliness and helpfulness of the staff and dentists were good at explaining the treatment that was proposed.

No action

Are services responsive to people's needs?

We found that this practice was providing responsive care in accordance with the relevant regulations.

The service was aware of the needs of the local population and took these into account in how the practice was run.

Patients could access treatment and urgent and emergency care when required.

The practice had two treatment rooms, of which one was based on the ground floor and level access into the building (via a ramp) for patients with mobility difficulties and families with prams and pushchairs.

No action

Summary of findings

Are services well-led?

We found that this practice was providing well-led care in accordance with the relevant regulations.

Effective leadership was provided by the practice owner who demonstrated an open approach to their work and shared a commitment to continually improving the service they provided.

There was a no blame culture in the practice. The practice had reasonable clinical governance and risk management structures in place although there were areas where systems and processes could be improved.

We saw evidence of systems to identify staff learning needs which were underpinned by the use of a twice daily practice 'huddle' where all staff came together to discuss problems of the day. The practice also carried out essential clinical audit in infection control and the quality of dental X-rays. Staff working at the practice were supported to maintain their continuing professional development as required by the General Dental Council.

Staff told us that they felt well supported and could raise any concerns with the practice owner. All the staff we met said that they were happy in their work and the practice was a good place to work.

No action

J Tan Dental Surgery

Detailed findings

Background to this inspection

We carried out an announced, comprehensive inspection on 16 August 2016. Our inspection was carried out by a lead inspector and a dental specialist adviser.

During our inspection visit, we reviewed policy documents and staff training and recruitment records. We obtained the views of four members of staff.

We conducted a tour of the practice and looked at the storage arrangements for emergency medicines and equipment. We were shown the decontamination procedures for dental instruments and the systems that supported the patient dental care records. We obtained the views of six patients on the day of our inspection.

Patients gave positive feedback about their experience at the practice.

To get to the heart of patients' experiences of care and treatment, we always ask the following five questions:

- Is it safe?
- Is it effective?
- Is it caring?
- Is it responsive to people's needs?
- Is it well-led?

These questions therefore formed the framework for the areas we looked at during the inspection.

Are services safe?

Our findings

Reporting, learning and improvement from incidents

The practice owner demonstrated an awareness of RIDDOR 2013 (reporting of injuries, diseases and dangerous occurrences regulations). We noted in the practice governance file a Health and Safety Executive directive detailing RIDDOR procedures and a RIDDOR reporting system. The practice had an incident and accident reporting system in place when something went wrong; this system also included the reporting of minor injuries to patients and staff.

Records showed that no such accidents occurred during 2015-16. The practice previously received national patient safety alerts such as those issued by the Medicines and Healthcare Regulatory Agency (MHRA) but the system had now lapsed. The practice owner assured us that the system would be re-established as soon as practically possible.

Reliable safety systems and processes (including safeguarding)

We spoke to a dental nurse about the prevention of needle stick injuries. They explained that the treatment of sharps and sharps waste was in accordance with the current EU directive with respect to safe sharp guidelines, thus helping to protect staff from blood borne diseases. The practice used a system whereby needles were not manually re-sheathed using the hands following administration of a local anaesthetic to a patient. The practice used a special safety syringe for the administration of dental local anaesthetics to prevent needle stick injuries from occurring. Dentist were also responsible for the disposal of used sharps and needles. A practice protocol was in place should a needle stick injury occur. The systems and processes we observed were in line with the current EU Directive on the use of safer sharps.

We asked a dental nurse how they treated the use of instruments used during root canal treatment. They explained that these instruments were single patient use only. The practice followed appropriate guidance issued by the British Endodontic Society in relation to the use of the rubber dam. They explained that root canal treatment was carried out where practically possible using a rubber dam. If a rubber dam could not be used the dentist used a special 'parachute safety chain' to prevent patients swallowing or inhaling root canal instruments. A rubber

dam is a thin, rectangular sheet, usually latex rubber, used in dentistry to isolate the operative site from the rest of the mouth and protect the airway. Rubber dams should be used when endodontic treatment is being provided.

The practice owner was the safeguarding lead who was the point of referral should members of staff encounter a child or adult safeguarding issue. A policy and protocol was in place for staff to refer to in relation to children and adults who may be the victim of abuse or neglect. Training records showed that not all staff had received appropriate safeguarding training for both vulnerable adults and children. The practice owner assured us that the appropriate level of training would be arranged as soon as practically possible. Information was available in the practice that contained telephone numbers of whom to contact outside of the practice if there was a need, such as the local authority responsible for investigations. The practice reported that there had been no safeguarding incidents that required further investigation by appropriate authorities.

Medical emergencies

The practice had arrangements in place to deal with medical emergencies at the practice. The practice had an automated external defibrillator (AED), a portable electronic device that analyses life threatening irregularities of the heart and is able to deliver an electrical shock to attempt to restore a normal heart rhythm. Staff had received training in how to use this equipment.

The practice had in place emergency medicines as set out in the British National Formulary guidance for dealing with common medical emergencies in a dental practice. The practice had access to medical oxygen along with other related items such as manual breathing aids and portable suction in line with the Resuscitation Council UK guidelines. The emergency medicines and oxygen we saw were all in date apart from the medicine glucagon and stored in a central location known to all staff. The issue with the expiry date of the glucagon was that the expiry date had not been adjusted for storage outside of a refrigerator. When we pointed this out to the owner we were told they would write the revised use by date on the item in future.

The practice held training sessions each year for the whole team so that they could maintain their competence in dealing with medical emergencies. Staff we spoke with demonstrated they knew how to respond if a person suddenly became unwell.

Are services safe?

Staff recruitment

All of the dentists, dental hygienist and dental nurses had current registration with the General Dental Council, the dental professionals' regulatory body.

The practice made use of British Dental Association (BDA) recruitment guidelines but did not have a practice specific policy which should detail the checks required to be undertaken before a person started work. For example, proof of identity, a full employment history, evidence of relevant qualifications, adequate medical indemnity cover, immunisation status and references.

We looked at one staff recruitment file and records examined confirmed a shortfall in the retention of appropriate recruitment documents. We spoke with the practice owner who immediately sourced the required missing documents and assured us they would create a recruitment policy which would detail recruitment requirements under Schedule 3 of the Health and Social care Act (2014) as soon as practicably possible.

Staff recruitment records were ordered and stored securely.

We saw that all staff had received appropriate checks from the Disclosure and Barring Service (DBS). These are checks to identify whether a person has a criminal record or is on an official list of people barred from working in roles where they may have contact with children or adults who may be vulnerable.

Monitoring health & safety and responding to risks

The practice had arrangements in place to monitor health and safety and deal with foreseeable emergencies. The practice maintained a system of policies and risk assessments which included radiation, fire safety, general health and safety and those pertaining to all the equipment used in the practice.

The practice had in place a Control of Substances Hazardous to Health (COSHH) file. This file contained details of the way substances and materials used in dentistry should be handled and the precautions taken to prevent harm to staff and patients.

Infection control

There were effective systems in place to reduce the risk and spread of infection within the practice. The practice had in place an infection control policy that was regularly reviewed. It was demonstrated through direct observation of the cleaning process and a review of practice protocols

that HTM 01 05 (national guidance for infection prevention and control in dental practices) Essential Quality Requirements for infection control was being met. It was observed that audit of infection control processes carried out in August 2016 confirmed compliance with HTM 01 05 guidelines.

We saw that the two dental treatment rooms, waiting area, reception and toilet were visibly clean, tidy and clutter free. Clear zoning demarking clean from dirty areas was apparent in all treatment rooms. Hand washing facilities were available including liquid soap and paper towels in each of the treatment rooms. Hand washing protocols were also displayed appropriately in various areas of the practice and bare below the elbow working was observed.

The drawers of the two treatment rooms were inspected and these were clean, ordered and free from clutter. Each treatment room had the appropriate routine personal protective equipment available for staff use, this included protective gloves and visors.

The dental nurse we spoke with described to us the end-to-end process of infection control procedures at the practice. They explained the decontamination of the general treatment room environment following the treatment of a patient. They demonstrated how the working surfaces, dental unit and dental chair were decontaminated. This included the treatment of the dental water lines.

The dental water lines were maintained to prevent the growth and spread of Legionella bacteria (Legionella is a term for particular bacteria which can contaminate water systems in buildings); they described the method they used which was in line with current HTM 01 05 guidelines. We saw that a Legionella risk assessment had been carried out and updated by the practice by a competent person in December 2015. The recommended procedures contained in the report including the testing of water quality and regular hot and cold temperature tests were carried out and logged appropriately. These measures ensured that patients and staff were protected from the risk of infection due to Legionella.

The practice had a separate decontamination room for instrument cleaning, sterilisation and the packaging of processed instruments. The dental nurse we spoke with demonstrated the process from taking the dirty

Are services safe?

instruments through to clean and ready for use again. The process of cleaning, inspection, sterilisation, packaging and storage of instruments followed a well-defined system of zoning from dirty through to clean.

The practice used a system of manual scrubbing for the initial cleaning process, following inspection with an illuminated magnifier; the instruments were placed in an autoclave (a device for sterilising dental and medical instruments). When the instruments had been sterilised, they were pouched and stored until required. All pouches were dated with an expiry date in accordance with current guidelines.

We were shown the systems in place to ensure that the autoclave used in the decontamination process was working effectively. It was observed that records used to record the essential daily and weekly validation checks of the sterilisation cycles were always complete and up to date.

The segregation and storage of clinical waste was in line with current guidelines laid down by the Department of Health. We observed that sharps containers, clinical waste bags and municipal waste were properly maintained in accordance with current guidelines. The practice used an appropriate contractor to remove clinical waste from the practice. This was stored in a separate locked location adjacent to the practice prior to collection by the waste contractor. Waste consignment notices were available for inspection.

We saw that general environmental cleaning was carried out according to a cleaning plan developed by the practice. Cleaning materials and equipment were stored in accordance with current national guidelines.

Equipment and medicines

Equipment checks were regularly carried out in line with the manufacturer's recommendations. For example, the autoclave had been serviced and calibrated in December 2015. We also noted that the Pressure Vessel Certificate for

the practice air compressor had been issued in August 2016. The practice's X-ray machines had been serviced and calibrated as specified under current national regulations in December 2015 and were due to be tested again in 2018.

Portable appliance testing (PAT) had been carried out in July 2016 and was due to be carried out again in 2017.

The batch numbers and expiry dates for local anaesthetics were recorded in patient dental care records. These medicines were stored securely for the protection of patients.

The practice also dispensed their own medicines as part of a patients' dental treatment. These medicines were a range of antibiotics, the dispensing procedures were in accordance with current secondary dispensing guidelines and medicines were stored according to manufacturer's instructions.

Radiography (X-rays)

We were shown a radiation protection file that contained documentation in line with the Ionising Radiation Regulations 1999 and Ionising Radiation Medical Exposure Regulations 2000 (IRMER). This file contained the names of the Radiation Protection Advisor and the Radiation Protection Supervisor and the necessary documentation pertaining to the maintenance of the X-ray equipment. Included in the file were the three yearly maintenance logs and a copy of the local rules.

We were shown that a radiological audit for the practice had been carried out in February 2016. Dental care records we saw where X-rays had been taken showed that dental X-rays were justified and reported on. These findings showed that the practice was acting in accordance with national radiological guidelines and patients and staff were protected from unnecessary exposure to radiation. We saw training records that showed staff where appropriate had received training for core radiological knowledge under IRMER 2000 Regulations.

Are services effective?

(for example, treatment is effective)

Our findings

Monitoring and improving outcomes for patients

The dentist we spoke with carried out consultations, assessments and treatment in line with recognised general professional guidelines. They described to us how they carried out their assessment of patients for routine care.

The assessment began with the patient completing a medical history questionnaire disclosing any health conditions, medicines being taken and any allergies suffered. We saw evidence that the medical history was updated at subsequent visits. This was followed by an examination covering the condition of a patient's teeth, gums and soft tissues and the signs of mouth cancer. Patients were then made aware of the condition of their oral health and whether it had changed since the last appointment. Following the clinical assessment, the diagnosis was then discussed with the patient along with the various treatment options.

Where relevant, preventative dental information was given in order to improve the outcome for the patient. This included dietary advice and general oral hygiene instruction such as tooth brushing techniques or recommended tooth care products. A treatment plan was then given to each patient and this included the cost involved. Patients were monitored through follow-up appointments and these were scheduled in line with their individual requirements.

Dental care records that were shown to us by the dentists demonstrated that the essential findings of the assessment and treatment carried out were recorded appropriately. We saw details of the condition of the gums using the basic periodontal examination (BPE) scores and soft tissues lining the mouth. The BPE tool is a simple and rapid screening tool used by dentists to indicate the level of treatment need in relation to a patient's gums. These were carried out where appropriate during a dental health assessment.

Health promotion & prevention

The practice was focused on the prevention of dental disease and the maintenance of good oral health. To facilitate this aim the practice appointed a dental hygienist to work alongside of the dentists in delivering preventative dental care.

The dental hygienist explained that the few children they treated who were at high risk of tooth decay, were offered fluoride varnish applications to keep their teeth in a healthy condition. They also placed fissure sealants (special plastic coatings on the biting surfaces of permanent back teeth in children who were particularly vulnerable to dental decay).

The dental hygienist went on to describe the advice that they gave which included tooth brushing techniques explained to patients in a way they understood and dietary, smoking and alcohol advice was given to them where appropriate. This was in line with the Department of Health guidelines on prevention known as 'Delivering Better Oral Health'.

Dental care records we observed demonstrated that oral health advice had been given to patients. The practice also sold a range of dental hygiene products to maintain healthy teeth and gums; these were available in the reception area.

Staffing

We observed a friendly atmosphere at the practice. All clinical staff had current registration with their professional body, the General Dental Council.

All of the patients we asked told us they felt there was enough staff working at the practice. Staff told us there were enough staff. Staff we spoke with told us they felt supported by the dentists and practice owner. They told us they felt they had acquired the necessary skills to carry out their role and were encouraged to progress.

The practice employs two dentists, one hygienist and two dental nurses of which one is a trainee on a recognised course.

The dental hygienist did not always work with chairside support. However, the hygienist explained that if they required chairside support during specific instances this was available. We drew to the attention of the practice manager the advice given in the General Dental Council's Standard (6.2.2) for the Dental Team about dental staff being supported by an appropriately trained member of the dental team at all times when treating patients in a dental setting.

Working with other services

The practice owner told us how they were able to refer patients to a range of specialists in primary and secondary services if the treatment required was not provided by the

Are services effective?

(for example, treatment is effective)

practice. For example, the practice used referral criteria and referral forms developed by other primary and secondary care providers such as oral surgery or head and neck cancer services. Generally, referrals were made to a particular specialty by written letter. We saw two examples of such referrals, both were appropriate and fit for purpose.

Consent to care and treatment

A dentist we spoke with explained how they implemented the principles of informed consent; they had a very clear understanding of consent issues. The dentist explained they would not normally provide treatment to patients during their examination appointment unless they were in pain or the presenting condition dictated otherwise. This allowed a cooling off period so that patients had time to think about the treatment options presented to them.

The dentist explained how individual treatment options and costs were discussed with each patient and then

documented in a written treatment plan. They stressed the importance of communication skills when explaining care and treatment to patients to help ensure they had an understanding of their treatment options.

The dentist went on to explain how they would obtain consent from a patient who suffered with any mental impairment that may mean that they might be unable to fully understand the implications of their treatment. If there was any doubt about their ability to understand or consent to the treatment, then treatment would be postponed. They added they would involve relatives and carers if appropriate to ensure that the best interests of the patient were served as part of the process. This followed the guidelines of the Mental Capacity Act 2005. Staff were familiar with the concept of Gillick competence in respect of the care and treatment of children under 16. Gillick competence is used to help assess whether a child has the maturity to make their own decisions and to understand the implications of those decisions.

Are services caring?

Our findings

Respect, dignity, compassion & empathy

Treatment rooms were situated away from the main waiting areas and we saw that doors were closed at all times when patients were with dentists.

Conversations between patients and dentists could not be heard from outside the treatment rooms which protected patients' privacy. Patients' clinical records were stored in paper form. Paper records were stored in an area of the practice not accessible to unauthorised members of the general public.

The practice computer screen was not overlooked which ensured patients' confidential information could not be viewed at reception. Staff were aware of the importance of providing patients with privacy and maintaining confidentiality.

We obtained the views of 25 patients prior to the day of our visit and six patients on the day of our visit. These provided a positive view of the service the practice provided. All of

the patients commented that the dentists were good at treating them with care and concern. Patients commented that treatment was explained clearly and the staff were caring and put them at ease. They also said that the reception staff were helpful and efficient. During the inspection, we observed staff in the reception area, they were polite and helpful towards patients and the general atmosphere was welcoming and friendly.

Involvement in decisions about care and treatment

The practice provided clear treatment plans to their patients that detailed possible treatment options and indicative costs. A poster detailed the costs of private treatment.

The dentist we spoke with paid particular attention to patient involvement when drawing up individual care plans. We saw evidence in the records we looked at that the dentists recorded the information they had provided to patients about their treatment and the options open to them. This included information recorded on estimates and treatment plan forms for private patients.

Are services responsive to people's needs?

(for example, to feedback?)

Our findings

Responding to and meeting patients' needs

During our inspection we looked at examples of information available to patients. We saw that the practice waiting area displayed a variety of information. These explained opening hours, emergency 'out of hours' contact details and arrangements and how to make a complaint.

We observed that the appointment diaries were not overbooked and that this provided capacity each day for patients with dental pain to be fitted into urgent slots for each dentist.

The dentists decided how long a patient's appointment needed to be and took into account any special circumstances such as whether a patient was very nervous, had an impairment and the level of complexity of treatment.

Tackling inequity and promoting equality

The practice had made some reasonable adjustments to help prevent inequity for patients that experienced limited mobility or other issues that may hamper them from accessing services.

To improve access for patients who found steps a barrier, the practice made a ramp available for patients who required level access and one treatment room was on the ground floor. Due to the layout of the building it was not possible to install a wheelchair accessible toilet but staff told us there were facilities in a nearby supermarket.

The practice did not have access to translation services or a hearing loop in place for patients who may be hearing aid wearers. We spoke with the practice owner about this and they assured us they would address this shortfall as soon as practicably possible.

Access to the service

The practice's opening hours were between 9am and 4pm on Monday, Wednesday and Friday and 9am and 5pm on Tuesday and Thursday.

All the patients we asked told us they were satisfied with the hours the surgery was open.

The practice owner provided advice and treatment in an emergency when the practice was closed. Contact information was publicised in the practice patient waiting area and on the telephone answering machine when the practice was closed.

Concerns & complaints

There was a complaints policy which provided staff with information about handling formal complaints from patients. Staff told us the practice team viewed complaints as a learning opportunity and discussed those received in order to improve the quality of service provided,

Information for patients about how to make a complaint was available in the practice's waiting room. This included contact details of other agencies to contact if a patient was not satisfied with the outcome of the practice investigation into their complaint. We asked six patients if they knew how to make a complaint if they had an issue and four said yes and two were not sure.

We looked at the practice procedure for acknowledging, recording, investigating and responding to complaints, concerns and suggestions made by patients and found there was an effective system in place which ensured a timely response. For example, a complaint would be acknowledged within three working days and a full response would be given in 10 days. We were shown the complaints log which showed that no complaints had been received in the past 12 months.

Are services well-led?

Our findings

Governance arrangements

The governance arrangements for this location consisted of the practice owner who was responsible for the day to day running of the practice. They were assisted by two long standing members of staff.

The practice maintained a system of policies and procedures using a practice file. All of the staff we spoke with were aware of the policies and how to access them. We noted management policies and procedures were kept under review by the practice owner on a regular basis.

Leadership, openness and transparency

Leadership was provided by the practice owner. The practice ethos focused on providing patient centred dental care in a relaxed and friendly environment. The comment cards we saw reflected this approach.

The staff we spoke with described a transparent culture which encouraged candour, openness and honesty. Staff said they felt comfortable about raising concerns with the practice owner. There was a no blame culture within the practice. They felt they were listened to and responded to when they did raise a concern. We found staff to be hard working, caring and committed to the work they did.

All of the staff we spoke with demonstrated a firm understanding of the principles of clinical governance in dentistry and were happy with the practice facilities. Staff reported that the practice owner was proactive and aimed to resolve problems very quickly. As a result, staff were motivated and enjoyed working at the practice and were proud of the service they provided to patients.

Learning and improvement

We saw evidence of systems to identify staff learning needs which were underpinned by the use of a twice daily practice 'huddle' where all staff came together to discuss problems of the day. The practice also carried out essential

clinical audit in infection control and the quality of dental X-rays. There was a system of peer review in place to facilitate the learning and development needs of the dentists and dental nurses.

Staff working at the practice was supported to maintain their continuing professional development as required by the General Dental Council. Staff told us that the practice ethos was that all staff should receive appropriate training and development.

The practice owner encouraged staff to carry out professional development wherever possible. The practice used a variety of ways to ensure staff development including internal training and staff meetings as well as attendance at external courses.

The practice ensured that all staff underwent regular mandatory training in cardio pulmonary resuscitation (CPR), infection control and dental radiography (X-rays).

Practice seeks and acts on feedback from its patients, the public and staff

The practice gathered feedback from patients through surveys, compliments and complaints. We saw that there was a robust complaints procedure in place, with details available for patients in the waiting area.

Results of the most recent practice survey carried indicated that 100% of patients, who responded, said they were happy with the care and treatment provided by the practice. As a result of patient feedback the practice introduced a wider variety of magazine titles in the waiting area.

Staff told us that the dentists were very approachable and they felt they could give their views about how things were done at the practice. Staff told us that they had frequent meetings and described the meetings as good with the opportunity to discuss successes, changes and improvements. For example, changes included redecorating the practice.
